

CLASSIC DOBSONIAN TELESCOPES

HIGH-QUALITY LIGHT BUCKETS WITH OLD SCHOOL CHARM

2-inch Focusers

With their 1.25-inch adapters, these focusers accommodate all popular eyepieces

Easy two-piece assembly

Sky-Watcher Classic Dobsonians quickly disassemble into tube and base for quick transport or storage

Award-winning optics

Sky-Watcher's 94% reflectivity mirrors ensure you get bright, detailed views

Sky-Watcher®

Be amazed.

Classic 150P

Classic 200P

Classic 250P

A simple, elegant form of an alt-azimuth mount made to carry a Newtonian reflector was popularized by John Dobson in the late 1970s. The Dobsonian mounted telescope has been a favorite among amateur astronomers and telescope makers because of its simplicity and ease of use ever since.

The Sky-Watcher Classic Dobsonian has a parabolic primary mirror to eliminate spherical aberration and a four-arm, secondary mirror bracket

with fine supports (0.5mm thick), to reduce diffraction spikes and light loss. In addition, these models include a 2-inch focuser with a 1.25-inch adapter, allowing the use of either eyepiece size. These models also include the new feature-tension control handle.
